should not be more than 10% smaller than the target amplicon and the use of a smaller internal control should be justified.

BAP.06630 Melting Temperature **Phase I**

For tests that generate a result based on a T_m, appropriately narrow temperature ranges (+/- 2.5°C) are defined and recorded each day of use.

IN SITU HYBRIDIZATION (ISH)

The use of the term in situ hybridization (ISH) in this section applies to all ISH methods, including fluorescence (FISH), chromogenic (CISH), silver (SISH), and brightfield (BRISH) in situ hybridization.

Please refer to the Definition of Terms section in the All Common (COM) Checklist for definitions of analytical validation and analytical verification.

Inspector Instructions:

	• Sampling of ISH policies and procedures • Sampling of probe validation/verification records • Sampling of QC records • Sampling of patient test reports
	• How are ISH cut-off values established? • How does your laboratory validate/verify assay performance prior to test implementation? • What is your course of action when a probe does not produce an internal control signal?

BAP.06710 ISH Probe Validation/Verification **Phase II**

All in situ hybridization (ISH) probes are validated/verified.

NOTE: Additional requirements for test method validation/verification are in the All Common Checklist.

Evidence of Compliance:

✓ Records of ISH probe validation/verification

BAP.06720 Interphase ISH - Cut-off Value **Phase II**

For interphase in situ hybridization (ISH), the biorepository establishes a normal cut-off value for results for each probe used, when applicable.
