

A minimum of five cells, with the exception of abbreviated studies, are analyzed.

NOTE 1: Under special clinical circumstances, fewer than five cells may be analyzed. Examples of such circumstances are confirmation of an abnormal prenatal chromosome result, in conjunction with chromosomal microarray analysis, or peripheral blood chromosome studies on family members to exclude a previously identified chromosome rearrangement. The laboratory must have written criteria for the circumstances under which an abbreviated study can be performed. Criteria should address the rationale for such studies, the clinical reason for referral, and the minimum number of cells analyzed.

NOTE 2: Under other special clinical circumstances (eg, rule out mosaicism of a numerical or structural abnormality, including sex chromosome mosaicism, which may involve both numerical and structural abnormalities), additional cells may need to be analyzed. The laboratory must have written criteria for the circumstances in which additional cells should be analyzed.

Evidence of Compliance:

- ✓ Patient records/worksheets

CYG.41500 Analysis - Neoplastic Samples

Phase II

For neoplastic disorders studied in marrow, blood or solid tumor specimens, at least 20 cells are analyzed, if possible.

NOTE: Under special clinical circumstances, fewer than 20 cells may be analyzed in lymphomas, solid tumors, and metastatic neoplasms with complex karyotypes. A sufficient number of metaphase cells (generally at least 10) should be analyzed to permit characterization of the abnormal clone(s). The circumstances under which abbreviated studies may be performed must be stated in the laboratory procedure.

CYG.41550 Analysis - Neoplastic Samples

Phase I

For neoplastic bone marrow/blood/solid tumor specimens, two or more cultures are analyzed, when possible.

NOTE: For neoplastic bone marrow/blood/solid tumor specimens, cells from two or more culture conditions are analyzed, when possible.

Evidence of Compliance:

- ✓ Patient records/worksheets
