 <p><b>ASK</b></p>	<ul style="list-style-type: none"> <li>How are ISH cut-off values established?</li> <li>How does your laboratory validate assay performance prior to test implementation?</li> <li>What is your course of action when a probe does not produce an internal control signal?</li> </ul>

### ANP.22956 ISH Probe Validation/Verification

Phase II

**All in situ hybridization (ISH) probes are validated/verified.**

*NOTE: Refer to ANP.22978 for specific validation/verification requirements for tests that provide independent predictive information (eg, HER2 in breast carcinoma). Additional requirements for test method validation/verification are in the All Common Checklist.*

**Evidence of Compliance:**

- ✓ Records of ISH probe validation/verification

### ANP.22957 Interphase ISH - Cut-off Value

Phase II

**For interphase in situ hybridization (ISH), the laboratory establishes a normal cut-off value for results for each probe used, when applicable.**

*NOTE: Refer to the All Common Checklist for specific test method validation requirements. Cut-off values are usually required when ISH testing uses locus-specific probes against nuclear DNA.*

**Evidence of Compliance:**

- ✓ Records from cut-off value studies

### ANP.22959 ISH Assay Performance

Phase I

**There are records of in situ hybridization (ISH) performance for each assay.**

*NOTE: Assay performance should include monitoring hybridization efficiency, probe signal intensity and overall assay results, including controls, as applicable.*

**Evidence of Compliance:**

- ✓ Records of QC monitoring of ISH assay performance at defined frequency

**ANP.22960 ISH Probe Intended Target Phase I**

**A system is used to ensure that the in situ hybridization (ISH) probe used is for the intended target.**

*NOTE: Examples can include (but may not be limited to): 1) concurrent analysis of any available metaphase cells in an interphase cell analysis; 2) inclusion of an internal or external target that results in a positive signal for each hybridization; 3) written protocols that ensure the respective probe is applied to the intended specimen.*

**Evidence of Compliance:**

- ✓ Records confirming intended target

**ANP.22963 ISH Scoring Phase II**

**Scoring of in situ hybridization (ISH) assays, including the number of cells scored, is performed as defined in a written procedure.**

*NOTE: For predictive marker testing, refer to ANP.22969 for requirements on reporting of the scoring method used.*

**ANP.22964 ISH Controls Phase II**

**The laboratory performs and records controls (internal and/or external) for each in situ hybridization (ISH) analysis.**

*NOTE: What functions as a control depends on the specific assay, signal pattern present, and sample type. For example, assays designed to detect deletions may use internal controls that include both the probe of interest and a control locus probe, both of which map to the same chromosome. In this situation, there are two internal controls, the signal for the probe of interest on the normal homolog and the control locus signals on both the normal and deleted homolog. For a dual fusion assay, the probe signals on each of the normal homologs function as internal controls. If a probe is used that does not produce an internal control signal (eg, a Y chromosome probe in a female), another sample that is known to have the probe target must be run in parallel as an external control with the patient sample. In addition, many ISH assays use an external control(s). For FDA-cleared or approved ISH assays, laboratories must follow manufacturer's instructions for quality control at minimum.*

**Evidence of Compliance:**

- ✓ Records of QC results
